18W FLUSH MOUNT POWER SUPPLY

Our range of encapsulated 18W power supplies offers the perfect solution if your application demands extended service life and protection from harsh environments.
The compact shape is designed to be out of sight, fitting comfortably inside a wall mount installation box. Alternatively the power supply can be fixed to any surface using the integrated mounting holes.
Polyurethane potting resin protects the electronic components from mechanical stress and water ingress to IP68.

Features

- Fully encapsulated
- IP68 waterproof
- MTBF 45 years at 50°C ambient
- Ultra low standby losses
- High Efficiency
- Protection class II
- Various connection options
- Thermally protected and short circuit proof
- Premium quality Japanese brand capacitors
- Manufacturing according to ISO 9001
- Designed in Austria
- Made in the Czech Republic

Specification		
Output Power	18	W
Output Voltage	5 – 24	V
Output current	2.5	A
Universal input voltage	90 - 264	V
Operating temperature	-20 - 80	°C
Efficiency	typ. 86	%
Standby Power	typ. 51	mW
Efficiency level	VI	
Means of protection	2 x MOPP	
Insulation of output	SELV	
Leakage current	max. 100	µA

EMC – Special requirements according medical standard (Only for medical devices)	
Intended use and intended environment	Home healthcare and/or Professional environment
Basic safety and essential performance of the EUT	The power supply unit is not a medical end product, therefore no essential performance is defined by the manufacturer.
Basic safety regarding EMC	The power supply has to ensure proper output voltage according to its characteristics, without service within expected service life.
WARNINGS	Medical electrical equipment needs special precautions regarding EMC and needs to be installed according to EMC information.
	PE of power supply shall be connected to PE of end medical product. User shall not modify power supply.
	The switch mode power supply is designed to achieve the EMI behavior of the specified environment, it includes specific EMI filter to reduce the emissions which are specified in the IEC60601-1-2 standard.
	Please read the complete technical documentation to avoid adverse events to the patient and operator. Read also instructions for use.

EMC - Environment			
The power supply is intended for use in the electromagnetic environment specified below. The customer or the user of the power supply should assure that it is used in such an environment.			
Emissions test	**Compliance**	**Electromagnetic environment - guidance**	
RF emissions CISPR 11	Group 1	The power supply uses RF energy only for its internal function. Therefore, its RF emissions are very low and are not likely to cause any interference in nearby electronic equipment.	
RF emissions CISPR 11	Class B	The power supply is suitable for use in all establishments, including domestic establishments and those directly connected to the public low-voltage power supply network that supplies buildings used for domestic purposes.	
Harmonic emissions IEC 61000-3-2	Complies		
Voltage fluctuations / flicker emissions IEC 61000-3-3	Complies		
Immunity test	**EN 60601-1-2:2015+A1:2021 test level**	**Achieved levels according EN 60601-1-2:2015+A1:2021 and achieved levels from additional standards.**	**Electromagnetic environment - guidance**

Power frequency (50/60 Hz) magnetic field IEC 61000-4-8	30 A/m	1, 3, 30 A/m	Power should be at levels characteristic of frequency magnetic fields a typical location in a typical commercial or hospital environment.
Conducted RF IEC 61000-4-6	6 Vrms 150 kHz to 80 MHz	6 Vrms	Portable and mobile RF communications equipment should not be used closer to any part of the power supply, including cables, than the recommended separation distance. Recommended separation distances see following table.
Radiated RF IEC 61000-4-3	10 V/m 80 MHz to 2.7 GHz	10 V/m	

Field strengths from fixed transmitters such as base stations for radio (cellular/cordless) telephones, land mobile radios, amateur radio, AM and FM radio broadcast and TV broadcast, cannot be predicted theoretically with accuracy. To assess the electromagnetic environment due to fixed RF transmitters an electromagnetic site survey should be considered. If the measured field strength in the location in which the power supply is used, exceeds the applicable RF compliance level above, the power supply should be observed to verify normal operation. If abnormal performance is observed, additional measures may be necessary, such as reorienting or relocating the power supply.

Field strengths from fixed RF transmitters, as determined by an electromagnetic site survey should be less than the compliance level in each frequency range. Over the frequency range 150 kHz to 80 MHz, field strength should be less than 3 V/m.

Interference may occur in the vicinity of equipment marked with the following symbol:

Proximity fields from RF wireless communications equipment IEC 61000-4-3

Frequency range and Level: RF wireless communication equipment

Test Frequency (MHz)	Modulation	Immunity Level (V/m)
385	**Pulse Modulation: 18Hz	27
450	*FM ±5Hz deviation: 1kHz sine	28
710 745 780	**Pulse Modulation: 217Hz	9
810 870 930	**Pulse Modulation: 18Hz	28
1720 1845 1970	**Pulse Modulation: 217Hz	28
2450	**Pulse Modulation: 217Hz	28
5240 5500 5785	**Pulse Modulation: 217Hz	9

Supplementary information:

EUT powered at one of the nominal input voltages and frequencies.

Dwell time minimum 1s. Actual dwell time noted in results table.

Note * - As an alternative to FM modulation, 50% pulse modulation at 18Hz may be used because while it does not represent actual modulation, it would be worst case.

Note ** - The carrier shall be modulated using 50% duty cycle square wave signal.

Recommended separation distances between portable and mobile RF communications equipment and the power supply

The power supply is intended for use in the electromagnetic environment in which radiated RF disturbances are controlled. The customer or the user of the power supply can help prevent electromagnetic interference by maintaining a minimum distance between portable and mobile RF communications equipment (transmitters) and the power supply as recommended below, according to the maximum output power of the communication equipment.

Rated maximum output power of transmitter (W)	Separation distance according to frequency of transmitter (m)		
	150 kHz to 80 MHz $d = 1.2\sqrt{P}$	80 MHz to 800 MHz $d = 1.2\sqrt{P}$	800 MHz to 2.5 GHz $d = 2.3\sqrt{P}$
0.01	0.12	0.12	0.23

0.1	0.38	0.38	0.73
1	1.2	1.2	2.3
10	3.8	3.8	7.3
100	12	12	23
For transmitters rated at a maximum output power not listed above, the recommended separation distance d in metres (m) can be determined using the equation applicable to the frequency of the transmitter, where P is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer. NOTE 1 At 80 MHz and 800 MHz, the separation distance for the higher frequency range applies. NOTE 4 These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.			

Energy Efficiency

This power supply family fulfills Directive 2009/125/EC with Commission Regulation (EU) 2019/1782. The vales “Average active efficiency”, “Efficiency at low load” and “No-load power consumption” are typical measured values, measured at one representative sample at an input voltage of 230VAC.

Input specification		
Input Voltage	100-240	VAC
Input Frequency	50-60	Hz

	Output specification					
Output voltage	5	9	12	15	24	VDC
Output current	2,5	1,5	1,5	1,2	0,75	A
